NEXT STEPS FOR HVA

- Check the ODBC connection at Rstudio-Connect Server side (Installed Location of Rstudio-Connect)

- If ODBC and HANA client not installed on it then admin should install and configure it then test the SAP Hana connection.

- Make package of HVA project and test it on others systems, if it's works then try to use it On-Premises

- Check which tools are suitable for ETL process

- Check which tables can we use at csv and update those csv on weekly basis using scheduler to by-pass SAP hana connection (Need to check which tables not update on daily basis, so we can export data from those tables in csv and use those csv as backend, those csv will be automatically updates on weekly basis)
